## H3Dr1.1 SQL Statements & Structure

The letters SQL stand for Structured Query Language. As with all languages—even computer languages—there are grammar rules. This includes a certain structure to statements, acceptable punctuation (i.e., operators and delimiters), and a vocabulary (i.e., reserve words).

## Description

The `CREATE USER` statement creates new MariaDB accounts. To use it, you must have the global [CREATE USER](#) privilege or the [INSERT](#) privilege for the [mysql](#) database. For each account, `CREATE USER` creates a new row in [mysql.user](#) (until [MariaDB 10.3](#) this is a table, from [MariaDB 10.4](#) it's a view) or [mysql.global\\_priv\\_table](#) (from [MariaDB 10.4](#)) that has no privileges.

If any of the specified accounts, or any permissions for the specified accounts, already exist, then the server returns `ERROR 1396 (HY000)`. If an error occurs, `CREATE USER` will still create the accounts that do not result in an error. Only one error is produced for all users which have not been created:

```
ERROR 1396 (HY000):
  Operation CREATE USER failed for 'u1'@'%','u2'@'%'
```

`CREATE USER` , [DROP USER](#), [CREATE ROLE](#), and [DROP ROLE](#) all produce the same error code when they fail.

See [Account Names](#) below for details on how account names are specified.

# OR REPLACE

If the optional `OR REPLACE` clause is used, it is basically a shortcut for:

```
DROP USER IF EXISTS name;
CREATE USER name ...;
```

For example:

```
CREATE USER foo2@test IDENTIFIED BY 'password';
ERROR 1396 (HY000): Operation CREATE USER failed for 'foo2'@'test'

CREATE OR REPLACE USER foo2@test IDENTIFIED BY 'password';
Query OK, 0 rows affected (0.00 sec)
```

# IF NOT EXISTS

When the `IF NOT EXISTS` clause is used, MariaDB will return a warning instead of an error if the specified user already exists.

For example:

```
CREATE USER foo2@test IDENTIFIED BY 'password';
ERROR 1396 (HY000): Operation CREATE USER failed for 'foo2'@'test'

CREATE USER IF NOT EXISTS foo2@test IDENTIFIED BY 'password';
Query OK, 0 rows affected, 1 warning (0.00 sec)

SHOW WARNINGS;
+-----+-----+-----+
| Level | Code | Message                                     |
+-----+-----+-----+
| Note  | 1973 | Can't create user 'foo2'@'test'; it already exists |
+-----+-----+-----+
```

# Authentication Options

## IDENTIFIED BY 'password'

The optional `IDENTIFIED BY` clause can be used to provide an account with a password. The password should be specified in plain text. It will be hashed by the [PASSWORD](#) function prior to being stored in the [mysql.user](#)/[mysql.global\\_priv\\_table](#) table.

For example, if our password is `mariadb` , then we can create the user with:

```
CREATE USER foo2@test IDENTIFIED BY 'mariadb';
```

If you do not specify a password with the `IDENTIFIED BY` clause, the user will be able to connect without a password. A blank password is not a wildcard to match any password. The user must connect without providing a password if no password is set.

The only [authentication plugins](#) that this clause supports are [mysql\\_native\\_password](#) and [mysql\\_old\\_password](#).

## IDENTIFIED BY PASSWORD 'password\_hash'

The optional `IDENTIFIED BY PASSWORD` clause can be used to provide an account with a password that has already been hashed. The password should be specified as a hash that was provided by the [PASSWORD](#) function. It will be stored in the [mysql.user](#)/[mysql.global\\_priv\\_table](#) table as-is.

For example, if our password is `mariadb` , then we can find the hash with:

```
SELECT PASSWORD('mariadb');
+-----+
| PASSWORD('mariadb') |
+-----+
| *54958E764CE10E50764C2EECB71D01F08549980 |
+-----+
1 row in set (0.00 sec)
```

And then we can create a user with the hash:

```
CREATE USER foo2@test IDENTIFIED BY PASSWORD '*54958E764CE10E50764C2EECB71D01F08549980';
```

If you do not specify a password with the `IDENTIFIED BY` clause, the user will be able to connect without a password. A blank password is not a wildcard to match any password. The user must connect without providing a password if no password is set.

The only [authentication plugins](#) that this clause supports are [mysql\\_native\\_password](#) and [mysql\\_old\\_password](#).

## IDENTIFIED {VIA|WITH} authentication\_plugin

The optional `IDENTIFIED VIA authentication_plugin` allows you to specify that the account should be authenticated by a specific [authentication plugin](#). The plugin name must be an active authentication plugin as per [SHOW PLUGINS](#). If it doesn't show up in that output, then you will need to install it with [INSTALL PLUGIN](#) or

INSTALL SONAME

For example, this could be used with the PAM authentication plugin:

```
CREATE USER foo2@test IDENTIFIED VIA pam;
```

Some authentication plugins allow additional arguments to be specified after a USING or AS keyword. For example, the PAM authentication plugin accepts a service name:

```
CREATE USER foo2@test IDENTIFIED VIA pam USING 'mariadb';
```

The exact meaning of the additional argument would depend on the specific authentication plugin.

MariaDB starting with 10.4.0

The USING or AS keyword can also be used to provide a plain-text password to a plugin if it's provided as an argument to the PASSWORD() function. This is only valid for authentication plugins that have implemented a hook for the PASSWORD() function. For example, the ed25519 authentication plugin supports this:

CREATE USER safe@%' IDENTIFIED VIA ed25519 USING PASSWORD('secret');

MariaDB starting with 10.4.3

One can specify many authentication plugins, they all work as alternatives ways of authenticating a user:

CREATE USER safe@%' IDENTIFIED VIA ed25519 USING PASSWORD('secret') OR unix\_socket;

By default, when you create a user without specifying an authentication plugin, MariaDB uses the mysql\_native\_password plugin.

TLS Options

By default, MariaDB transmits data between the server and clients without encrypting it. This is generally acceptable when the server and client run on the same host or in networks where security is guaranteed through other means. However, in cases where the server and client exist on separate networks or they are in a high-risk network, the lack of encryption does introduce security concerns as a malicious actor could potentially eavesdrop on the traffic as it is sent over the network between them.

To mitigate this concern, MariaDB allows you to encrypt data in transit between the server and clients using the Transport Layer Security (TLS) protocol. TLS was formerly known as Secure Socket Layer (SSL), but strictly speaking the SSL protocol is a predecessor to TLS and, that version of the protocol is now considered insecure. The documentation still uses the term SSL often and for compatibility reasons TLS-related server system and status variables still use the prefix ssl\_, but internally, MariaDB only supports its secure successors.

See Secure Connections Overview for more information about how to determine whether your MariaDB server has TLS support.

You can set certain TLS-related restrictions for specific user accounts. For instance, you might use this with user accounts that require access to sensitive data while sending it across networks that you do not control. These restrictions can be enabled for a user account with the CREATE USER, ALTER USER, or GRANT statements. The following options are available:

Option	Description
REQUIRE NONE	TLS is not required for this account, but can still be used.
REQUIRE SSL	The account must use TLS, but no valid X509 certificate is required. This option cannot be combined with other TLS options.
REQUIRE X509	The account must use TLS and must have a valid X509 certificate. This option implies REQUIRE SSL. This option cannot be combined with other TLS options.
REQUIRE ISSUER 'issuer'	The account must use TLS and must have a valid X509 certificate. Also, the Certificate Authority must be the one specified via the string issuer. This option implies REQUIRE X509. This option can be combined with the SUBJECT, and CIPHER options in any order.
REQUIRE SUBJECT 'subject'	The account must use TLS and must have a valid X509 certificate. Also, the certificate's Subject must be the one specified via the string subject. This option implies REQUIRE X509. This option can be combined with the ISSUER, and CIPHER options in any order.
REQUIRE CIPHER 'cipher'	The account must use TLS, but no valid X509 certificate is required. Also, the encryption used for the connection must use a specific cipher method specified in the string cipher. This option implies REQUIRE SSL. This option can be combined with the ISSUER, and SUBJECT options in any order.

The REQUIRE keyword must be used only once for all specified options, and the AND keyword can be used to separate individual options, but it is not required.

For example, you can create a user account that requires these TLS options with the following:

```
CREATE USER 'alice'@%'
  REQUIRE SUBJECT '/CN=alice/O=My Dom, Inc./C=US/ST=Oregon/L=Portland'
  AND ISSUER '/C=FI/ST=Somewhere/L=City/ O=Some Company/CN=Peter Parker/emailAddress=p.parker@marvel.com'
  AND CIPHER 'SHA-DES-CBC3-EDH-RSA';
```

If any of these options are set for a specific user account, then any client who tries to connect with that user account will have to be configured to connect with TLS. See Securing Connections for Client and Server for information on how to enable TLS on the client and server.

Resource Limit Options

MariaDB starting with 10.2.0

MariaDB 10.2.0 introduced a number of resource limit options.

It is possible to set per-account limits for certain server resources. The following table shows the values that can be set per account:

Limit Type	Decription
MAX_QUERIES_PER_HOUR	Number of statements that the account can issue per hour (including updates)
MAX_UPDATES_PER_HOUR	Number of updates (not queries) that the account can issue per hour
MAX_CONNECTIONS_PER_HOUR	Number of connections that the account can start per hour
MAX_USER_CONNECTIONS	Number of simultaneous connections that can be accepted from the same account; if it is 0, <code>max_connections</code> will be used instead; if <code>max_connections</code> is 0, there is no limit for this account's simultaneous connections.
MAX_STATEMENT_TIME	Timeout, in seconds, for statements executed by the user. See also <a href="#">Aborting Statements that Exceed a Certain Time to Execute</a> .

If any of these limits are set to 0, then there is no limit for that resource for that user.

Here is an example showing how to create a user with resource limits:

```
CREATE USER 'someone'@'localhost' WITH
MAX_USER_CONNECTIONS 10
MAX_QUERIES_PER_HOUR 200;
```

The resources are tracked per account, which means 'user'@'server'; not per user name or per connection.

The count can be reset for all users using [FLUSH USER\\_RESOURCES](#), [FLUSH PRIVILEGES](#) or [mysqladmin reload](#).

Per account resource limits are stored in the [user](#) table, in the [mysql](#) database. Columns used for resources limits are named `max_questions`, `max_updates`, `max_connections` (for `MAX_CONNECTIONS_PER_HOUR`), and `max_user_connections` (for `MAX_USER_CONNECTIONS`).

## Account Names

Account names have both a user name component and a host name component, and are specified as 'user\_name'@'host\_name'.

The user name and host name may be unquoted, quoted as strings using double quotes (") or single quotes ('), or quoted as identifiers using backticks (`). You must use quotes when using special characters (such as a hyphen) or wildcard characters. If you quote, you must quote the user name and host name separately (for example 'user\_name'@'host\_name').

## Host Name Component

If the host name is not provided, it is assumed to be '%'.

Host names may contain the wildcard characters % and \_. They are matched as if by the [LIKE](#) clause. If you need to use a wildcard character literally (for example, to match a domain name with an underscore), prefix the character with a backslash. See [LIKE](#) for more information on escaping wildcard characters.

Host name matches are case-insensitive. Host names can match either domain names or IP addresses. Use 'localhost' as the host name to allow only local client connections.

You can use a netmask to match a range of IP addresses using 'base\_ip/netmask' as the host name. A user with an IP address *ip\_addr* will be allowed to connect if the following condition is true:

```
ip_addr & netmask = base_ip
```

For example, given a user:

```
CREATE USER 'maria'@'247.150.130.0/255.255.255.0';
```

the IP addresses satisfying this condition range from 247.150.130.0 to 247.150.130.255.

Using 255.255.255.255 is equivalent to not using a netmask at all. Netmasks cannot be used for IPv6 addresses.

Note that the credentials added when creating a user with the '%' wildcard host will not grant access in all cases. For example, some systems come with an anonymous localhost user, and when connecting from localhost this will take precedence.

Before [MariaDB 10.6](#), the host name component could be up to 60 characters in length. Starting from [MariaDB 10.6](#), it can be up to 255 characters.

## User Name Component

User names must match exactly, including case. A user name that is empty is known as an anonymous account and is allowed to match a login attempt with any user name component. These are described more in the next section.

For valid identifiers to use as user names, see [Identifier Names](#).

It is possible for more than one account to match when a user connects. MariaDB selects the first matching account after sorting according to the following criteria:

- Accounts with an exact host name are sorted before accounts using a wildcard in the host name. Host names using a netmask are considered to be exact for sorting.
- Accounts with a wildcard in the host name are sorted according to the position of the first wildcard character. Those with a wildcard character later in the host name sort before those with a wildcard character earlier in the host name.
- Accounts with a non-empty user name sort before accounts with an empty user name.
- Accounts with an empty user name are sorted last. As mentioned previously, these are known as anonymous accounts. These are described more in the next section.

The following table shows a list of example account as sorted by these criteria:

```
+-----+-----+
| User   | Host   |
+-----+-----+
| joffrey | 192.168.0.3 |
|         | 192.168.0.% |
| joffrey | 192.168.%   |
|         | 192.168.%   |
+-----+-----+
```

Once connected, you only have the privileges granted to the account that matched, not all accounts that could have matched. For example, consider the following commands:

```
CREATE USER 'joffrey'@'192.168.0.3';
CREATE USER 'joffrey'@'%';
GRANT SELECT ON test.t1 TO 'joffrey'@'192.168.0.3';
GRANT SELECT ON test.t2 TO 'joffrey'@'%';
```

If you connect as joffrey from 192.168.0.3, you will have the `SELECT` privilege on the table `test.t1`, but not on the table `test.t2`. If you connect as joffrey from any other IP address, you will have the `SELECT` privilege on the table `test.t2`, but not on the table `test.t1`.

Usemames can be up to 80 characters long before 10.6 and starting from 10.6 it can be 128 characters long.

## Anonymous Accounts

Anonymous accounts are accounts where the user name portion of the account name is empty. These accounts act as special catch-all accounts. If a user attempts to log into the system from a host, and an anonymous account exists with a host name portion that matches the user's host, then the user will log in as the anonymous account if there is no more specific account match for the user name that the user entered.

For example, here are some anonymous accounts:

```
CREATE USER ''@'localhost';
CREATE USER ''@'192.168.0.3';
```

### Fixing a Legacy Default Anonymous Account

On some systems, the `mysql.db` table has some entries for the `''@''` anonymous account by default. Unfortunately, there is no matching entry in the `mysql.user` / `mysql.global_priv` table, which means that this anonymous account doesn't exactly exist, but it does have privileges—usually on the default `test` database created by `mysql_install_db`. These account-less privileges are a legacy that is leftover from a time when MySQL's privilege system was less advanced.

This situation means that you will run into errors if you try to create a `''@''` account. For example:

```
CREATE USER ''@'';
ERROR 1396 (HY000): Operation CREATE USER failed for ''@''
```

The fix is to `DELETE` the row in the `mysql.db` table and then execute `FLUSH PRIVILEGES`:

```
DELETE FROM mysql.db WHERE User='' AND Host='%';
FLUSH PRIVILEGES;
```

And then the account can be created:

```
CREATE USER ''@'';
Query OK, 0 rows affected (0.01 sec)
```

See [MDEV-13486](#) for more information.

## Password Expiry

MariaDB starting with [10.4.3](#)

Besides automatic password expiry, as determined by `default_password_lifetime`, password expiry times can be set on an individual user basis, overriding the global setting, for example:

```
CREATE USER 'monty'@'localhost' PASSWORD EXPIRE INTERVAL 120 DAY;
```

See [User Password Expiry](#) for more details.

## Account Locking

MariaDB starting with [10.4.2](#)

Account locking permits privileged administrators to lock/unlock user accounts. No new client connections will be permitted if an account is locked (existing connections are not affected). For example:

```
CREATE USER 'marijn'@'localhost' ACCOUNT LOCK;
```

See [Account Locking](#) for more details.

From [MariaDB 10.4.7](#) and [MariaDB 10.5.8](#), the `lock_option` and `password_option` clauses can occur in either order.

# H3Dr1.1.1.1.2 ALTER

MariaDB starting with [10.2.0](#)

The ALTER USER statement was introduced in [MariaDB 10.2.0](#).

## Syntax

```
ALTER USER [IF EXISTS]
  user_specification [,user_specification] ...
  [REQUIRE {NONE | tls_option [[AND] tls_option] ...}]
  [WITH resource_option [resource_option] ...]
  [Lock_option] [password_option]

user_specification:
  username [authentication_option]

authentication_option:
  IDENTIFIED BY 'password'
  | IDENTIFIED BY PASSWORD 'password_hash'
  | IDENTIFIED {VIA|WITH} authentication_rule [OR authentication_rule] ...

authentication_rule:
  authentication_plugin
  | authentication_plugin {USING|AS} 'authentication_string'
  | authentication_plugin {USING|AS} PASSWORD('password')

tls_option
  SSL
  | X509
  | CIPHER 'cipher'
  | ISSUER 'issuer'
  | SUBJECT 'subject'

resource_option
  MAX_QUERIES_PER_HOUR count
  | MAX_UPDATES_PER_HOUR count
  | MAX_CONNECTIONS_PER_HOUR count
  | MAX_USER_CONNECTIONS count
  | MAX_STATEMENT_TIME time

password_option:
  PASSWORD EXPIRE
  | PASSWORD EXPIRE DEFAULT
  | PASSWORD EXPIRE NEVER
  | PASSWORD EXPIRE INTERVAL N DAY

Lock_option:
  ACCOUNT LOCK
  | ACCOUNT UNLOCK
}
```

## Description

The ALTER USER statement modifies existing MariaDB accounts. To use it, you must have the global [CREATE USER](#) privilege or the [UPDATE](#) privilege for the [mysql](#) database. The global [SUPER](#) privilege is also required if the [read\\_only](#) system variable is enabled.

If any of the specified user accounts do not yet exist, an error results. If an error occurs, ALTER USER will still modify the accounts that do not result in an error. Only one error is produced for all users which have not been modified.

## IF EXISTS

When the IF EXISTS clause is used, MariaDB will return a warning instead of an error for each specified user that does not exist.

# Account Names

For `ALTER USER` statements, account names are specified as the `username` argument in the same way as they are for `CREATE USER` statements. See [account names](#) from the `CREATE USER` page for details on how account names are specified.

`CURRENT_USER` or `CURRENT_USER()` can also be used to alter the account logged into the current session. For example, to change the current user's password to `mariadb`:

```
ALTER USER CURRENT_USER() IDENTIFIED BY 'mariadb';
```

# Authentication Options

MariaDB starting with 10.4

From [MariaDB 10.4](#), it is possible to use more than one authentication plugin for each user account. For example, this can be useful to slowly migrate users to the more secure `ed25519` authentication plugin over time, while allowing the old `mysql_native_password` authentication plugin as an alternative for the transitional period. See [Authentication from MariaDB 10.4](#) for more.

When running `ALTER USER`, not specifying an authentication option in the `IDENTIFIED VIA` clause will remove that authentication method. (However this was not the case before [MariaDB 10.4.13](#), see [MDEV-21928](#))

For example, a user is created with the ability to authenticate via both a password and `unix_socket`:

```
CREATE USER 'bob'@'localhost'
  IDENTIFIED VIA mysql_native_password USING PASSWORD('pwd')
  OR unix_socket;

SHOW CREATE USER 'bob'@'localhost'\G
***** 1. row *****
CREATE USER for bob@localhost: CREATE USER `bob`@'localhost'
  IDENTIFIED VIA mysql_native_password
  USING '*975B2CD4FF9AE554FE8AD33168FBFC326D2021DD'
  OR unix_socket
```

If the user's password is updated, but `unix_socket` authentication is not specified in the `IDENTIFIED VIA` clause, `unix_socket` authentication will no longer be permitted.

```
ALTER USER 'bob'@'localhost' IDENTIFIED VIA mysql_native_password
  USING PASSWORD('pwd2');

SHOW CREATE USER 'bob'@'localhost'\G
***** 1. row *****
CREATE USER for bob@localhost: CREATE USER `bob`@'localhost'
  IDENTIFIED BY PASSWORD '*38366FDA01695B6A5A9DD4E428D9FB8F7EB75512'
```

## IDENTIFIED BY 'password'

The optional `IDENTIFIED BY` clause can be used to provide an account with a password. The password should be specified in plain text. It will be hashed by the `PASSWORD` function prior to being stored to the `mysql.user` table.

For example, if our password is `mariadb`, then we can set the account's password with:

```
ALTER USER foo2@test IDENTIFIED BY 'mariadb';
```

If you do not specify a password with the `IDENTIFIED BY` clause, the user will be able to connect without a password. A blank password is not a wildcard to match any password. The user must connect without providing a password if no password is set.

The only authentication plugins that this clause supports are `mysql_native_password` and `mysql_old_password`.

## IDENTIFIED BY PASSWORD 'password\_hash'

The optional `IDENTIFIED BY PASSWORD` clause can be used to provide an account with a password that has already been hashed. The password should be specified as a hash that was provided by the `PASSWORD` function. It will be stored to the `mysql.user` table as-is.

For example, if our password is `mariadb`, then we can find the hash with:

```
SELECT PASSWORD('mariadb');
+-----+
| PASSWORD('mariadb') |
+-----+
| *54958E764CE10E50764C2EECB71D01F08549980 |
+-----+
```

And then we can set an account's password with the hash:

```
ALTER USER foo2@test
  IDENTIFIED BY PASSWORD '*54958E764CE10E50764C2EECB71D01F08549980';
```

If you do not specify a password with the `IDENTIFIED BY` clause, the user will be able to connect without a password. A blank password is not a wildcard to match any password. The user must connect without providing a password if no password is set.

The only authentication plugins that this clause supports are `mysql_native_password` and `mysql_old_password`.

## IDENTIFIED {VIA|WITH} authentication\_plugin

The optional `IDENTIFIED VIA authentication_plugin` allows you to specify that the account should be authenticated by a specific [authentication plugin](#). The plugin name must be an active authentication plugin as per [SHOW PLUGINS](#). If it doesn't show up in that output, then you will need to install it with [INSTALL PLUGIN](#) or [INSTALL SONAME](#).

For example, this could be used with the [PAM authentication plugin](#):

```
ALTER USER foo2@test IDENTIFIED VIA pam;
```

Some authentication plugins allow additional arguments to be specified after a `USING` or `AS` keyword. For example, the [PAM authentication plugin](#) accepts a [service name](#):

```
ALTER USER foo2@test IDENTIFIED VIA pam USING 'mariadb';
```

The exact meaning of the additional argument would depend on the specific authentication plugin.

In [MariaDB 10.4](#) and later, the `USING` or `AS` keyword can also be used to provide a plain-text password to a plugin if it's provided as an argument to the `PASSWORD()` function. This is only valid for [authentication plugins](#) that have implemented a hook for the `PASSWORD()` function. For example, the [ed25519](#) authentication plugin supports this:

```
ALTER USER safe@%' IDENTIFIED VIA ed25519 USING PASSWORD('secret');
```

## TLS Options

By default, MariaDB transmits data between the server and clients without encrypting it. This is generally acceptable when the server and client run on the same host or in networks where security is guaranteed through other means. However, in cases where the server and client exist on separate networks or they are in a high-risk network, the lack of encryption does introduce security concerns as a malicious actor could potentially eavesdrop on the traffic as it is sent over the network between them.

To mitigate this concern, MariaDB allows you to encrypt data in transit between the server and clients using the Transport Layer Security (TLS) protocol. TLS was formerly known as Secure Socket Layer (SSL), but strictly speaking the SSL protocol is a predecessor to TLS and, that version of the protocol is now considered insecure. The documentation still uses the term SSL often and for compatibility reasons TLS-related server system and status variables still use the prefix `ssl_`, but internally, MariaDB only supports its secure successors.

See [Secure Connections Overview](#) for more information about how to determine whether your MariaDB server has TLS support.

You can set certain TLS-related restrictions for specific user accounts. For instance, you might use this with user accounts that require access to sensitive data while sending it across networks that you do not control. These restrictions can be enabled for a user account with the [CREATE USER](#), [ALTER USER](#), or [GRANT](#) statements. The following options are available:

Option	Description
REQUIRE NONE	TLS is not required for this account, but can still be used.
REQUIRE SSL	The account must use TLS, but no valid X509 certificate is required. This option cannot be combined with other TLS options.
REQUIRE X509	The account must use TLS and must have a valid X509 certificate. This option implies <code>REQUIRE SSL</code> . This option cannot be combined with other TLS options.
REQUIRE ISSUER 'issuer'	The account must use TLS and must have a valid X509 certificate. Also, the Certificate Authority must be the one specified via the string <code>issuer</code> . This option implies <code>REQUIRE X509</code> . This option can be combined with the <code>SUBJECT</code> , and <code>CIPHER</code> options in any order.
REQUIRE SUBJECT 'subject'	The account must use TLS and must have a valid X509 certificate. Also, the certificate's Subject must be the one specified via the string <code>subject</code> . This option implies <code>REQUIRE X509</code> . This option can be combined with the <code>ISSUER</code> , and <code>CIPHER</code> options in any order.
REQUIRE CIPHER 'cipher'	The account must use TLS, but no valid X509 certificate is required. Also, the encryption used for the connection must use a specific cipher method specified in the string <code>cipher</code> . This option implies <code>REQUIRE SSL</code> . This option can be combined with the <code>ISSUER</code> , and <code>SUBJECT</code> options in any order.

The `REQUIRE` keyword must be used only once for all specified options, and the `AND` keyword can be used to separate individual options, but it is not required.

For example, you can alter a user account to require these TLS options with the following:

```
ALTER USER 'alice'@%'
  REQUIRE SUBJECT '/CN=alice/O=My Dom, Inc./C=US/ST=Oregon/L=Portland'
  AND ISSUER '/C=FI/ST=Somewhere/L=City/ O=Some Company/CN=Peter Parker/emailAddress=p.parker@marvel.com'
  AND CIPHER 'SHA-DES-CBC3-EDH-RSA';
```

If any of these options are set for a specific user account, then any client who tries to connect with that user account will have to be configured to connect with TLS.

See [Securing Connections for Client and Server](#) for information on how to enable TLS on the client and server.

## Resource Limit Options

MariaDB starting with [10.2.0](#)

MariaDB [10.2.0](#) introduced a number of resource limit options.

It is possible to set per-account limits for certain server resources. The following table shows the values that can be set per account:

Limit Type	Decription
MAX_QUERIES_PER_HOUR	Number of statements that the account can issue per hour (including updates)
MAX_UPDATES_PER_HOUR	Number of updates (not queries) that the account can issue per hour
MAX_CONNECTIONS_PER_HOUR	Number of connections that the account can start per hour

MAX_USER_CONNECTIONS	Number of simultaneous connections that can be accepted from the same account; if it is 0, <code>max_connections</code> will be used instead; if <code>max_connections</code> is 0, there is no limit for this account's simultaneous connections.
MAX_STATEMENT_TIME	Timeout, in seconds, for statements executed by the user. See also <a href="#">Aborting Statements that Exceed a Certain Time to Execute</a> .

If any of these limits are set to 0, then there is no limit for that resource for that user.

Here is an example showing how to set an account's resource limits:

```
ALTER USER 'someone'@'localhost' WITH
  MAX_USER_CONNECTIONS 10
  MAX_QUERIES_PER_HOUR 200;
```

The resources are tracked per account, which means 'user'@'server'; not per user name or per connection.

The count can be reset for all users using [FLUSH USER\\_RESOURCES](#), [FLUSH PRIVILEGES](#) or `mysqladmin reload`.

Per account resource limits are stored in the `user` table, in the `mysql` database. Columns used for resources limits are named `max_questions`, `max_updates`, `max_connections` (for `MAX_CONNECTIONS_PER_HOUR`), and `max_user_connections` (for `MAX_USER_CONNECTIONS`).

## Password Expiry

MariaDB starting with [10.4.3](#)

Besides automatic password expiry, as determined by [default\\_password\\_lifetime](#), password expiry times can be set on an individual user basis, overriding the global setting, for example:

```
ALTER USER 'monty'@'localhost' PASSWORD EXPIRE INTERVAL 120 DAY;
ALTER USER 'monty'@'localhost' PASSWORD EXPIRE NEVER;
ALTER USER 'monty'@'localhost' PASSWORD EXPIRE DEFAULT;
```

See [User Password Expiry](#) for more details.

## Account Locking

MariaDB starting with [10.4.2](#)

Account locking permits privileged administrators to lock/unlock user accounts. No new client connections will be permitted if an account is locked (existing connections are not affected). For example:

```
ALTER USER 'marijn'@'localhost' ACCOUNT LOCK;
```

See [Account Locking](#) for more details.

From [MariaDB 10.4.7](#) and [MariaDB 10.5.8](#), the `lock_option` and `password_option` clauses can occur in either order.

# H3Dr1.1.1.1.3 DROP

## Syntax

```
DROP USER [IF EXISTS] user_name [, user_name] ...
```

Contents

1. [Syntax](#)

2. [Description](#)

1. [IF EXISTS](#)

3. [Examples](#)

4. [See Also](#)

## Description

The `DROP USER` statement removes one or more MariaDB accounts. It removes privilege rows for the account from all grant tables. To use this statement, you must have the global `CREATE USER` privilege or the `DELETE` privilege for the `mysql` database. Each account is named using the same format as for the `CREATE USER` statement; for example, 'jeffrey'@'localhost'. If you specify only the user name part of the account name, a host name part of '%' is used. For additional information about specifying account names, see [CREATE USER](#).

Note that, if you specify an account that is currently connected, it will not be deleted until the connection is closed. The connection will not be automatically closed.

If any of the specified user accounts do not exist, `ERROR 1396 (HY000)` results. If an error occurs, `DROP USER` will still drop the accounts that do not result in an error. Only one error is produced for all users which have not been dropped:

```
ERROR 1396 (HY000): Operation DROP USER failed for 'u1'@'%','u2'@'%'
```

Failed `CREATE` or `DROP` operations, for both users and roles, produce the same error code.

IF EXISTS

If the `IF EXISTS` clause is used, MariaDB will return a note instead of an error if the user does not exist.

Examples

```
DROP USER bob;
```

IF EXISTS :

```
DROP USER bob;
ERROR 1396 (HY000): Operation DROP USER failed for 'bob'@'%'

DROP USER IF EXISTS bob;
Query OK, 0 rows affected, 1 warning (0.00 sec)

SHOW WARNINGS;
+-----+-----+-----+
| Level | Code | Message                                     |
+-----+-----+-----+
| Note  | 1974 | Can't drop user 'bob'@'%; it doesn't exist |
+-----+-----+-----+
```

    | ISSUER 'issuer'
    | SUBJECT 'subject'

```

## Description

The `GRANT` statement allows you to grant privileges or [roles](#) to accounts. To use `GRANT`, you must have the `GRANT OPTION` privilege, and you must have the privileges that you are granting.

Use the [REVOKE](#) statement to revoke privileges granted with the `GRANT` statement.

Use the [SHOW GRANTS](#) [🔗](#) statement to determine what privileges an account has.

## Account Names

For `GRANT` statements, account names are specified as the `username` argument in the same way as they are for [CREATE USER](#) statements. See [account names](#) from the `CREATE USER` page for details on how account names are specified.

## Implicit Account Creation

The `GRANT` statement also allows you to implicitly create accounts in some cases.

If the account does not yet exist, then `GRANT` can implicitly create it. To implicitly create an account with `GRANT`, a user is required to have the same privileges that would be required to explicitly create the account with the `CREATE USER` statement.

If the `NO_AUTO_CREATE_USER` [SQL\\_MODE](#) [🔗](#) is set, then accounts can only be created if authentication information is specified, or with a [CREATE USER](#) statement. If no

authentication information is provided, `GRANT` will produce an error when the specified account does not exist, for example:

```
show variables like '%sql_mode%';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| sql_mode      | NO_AUTO_CREATE_USER,NO_ENGINE_SUBSTITUTION |
+-----+-----+

GRANT USAGE ON *.* TO 'user123'@'%' IDENTIFIED BY '';
ERROR 1133 (28000): Can't find any matching row in the user table

GRANT USAGE ON *.* TO 'user123'@'%' IDENTIFIED VIA PAM using 'mariadb' require ssl;
Query OK, 0 rows affected (0.00 sec)

select host, user from mysql.user where user='user123';

+-----+-----+
| host | user |
+-----+-----+
| %    | user123 |
+-----+-----+
```

## Privilege Levels

Privileges can be set globally, for an entire database, for a table or routine, or for individual columns in a table. Certain privileges can only be set at certain levels.

- **Global privileges *priv\_type*** are granted using `*.*` for *priv\_level*. Global privileges include privileges to administer the database and manage user accounts, as well as privileges for all tables, functions, and procedures. Global privileges are stored in the [mysql.user table](#).
- **Database privileges *priv\_type*** are granted using `db_name.*` for *priv\_level*, or using just `*` to use default database. Database privileges include privileges to create tables and functions, as well as privileges for all tables, functions, and procedures in the database. Database privileges are stored in the [mysql.db table](#).
- **Table privileges *priv\_type*** are granted using `db_name.tbl_name` for *priv\_level*, or using just `tbl_name` to specify a table in the default database. The `TABLE` keyword is optional. Table privileges include the ability to select and change data in the table. Certain table privileges can be granted for individual columns.
- **Column privileges *priv\_type*** are granted by specifying a table for *priv\_level* and providing a column list after the privilege type. They allow you to control exactly which columns in a table users can select and change.
- **Function privileges *priv\_type*** are granted using `FUNCTION db_name.routine_name` for *priv\_level*, or using just `FUNCTION routine_name` to specify a function in the default database.
- **Procedure privileges *priv\_type*** are granted using `PROCEDURE db_name.routine_name` for *priv\_level*, or using just `PROCEDURE routine_name` to specify a procedure in the default database.

## The USAGE Privilege

The `USAGE` privilege grants no real privileges. The [SHOW GRANTS](#) statement will show a global `USAGE` privilege for a newly-created user. You can use `USAGE` with the `GRANT` statement to change options like `GRANT OPTION` and `MAX_USER_CONNECTIONS` without changing any account privileges.

## The ALL PRIVILEGES Privilege

The `ALL PRIVILEGES` privilege grants all available privileges. Granting all privileges only affects the given privilege level. For example, granting all privileges on a table does not grant any privileges on the database or globally.

Using `ALL PRIVILEGES` does not grant the special `GRANT OPTION` privilege.

You can use `ALL` instead of `ALL PRIVILEGES`.

## The GRANT OPTION Privilege

Use the `WITH GRANT OPTION` clause to give users the ability to grant privileges to other users at the given privilege level. Users with the `GRANT OPTION` privilege can only grant privileges they have. They cannot grant privileges at a higher privilege level than they have the `GRANT OPTION` privilege.

The `GRANT OPTION` privilege cannot be set for individual columns. If you use `WITH GRANT OPTION` when specifying [column privileges](#), the `GRANT OPTION` privilege will be granted for the entire table.

Using the `WITH GRANT OPTION` clause is equivalent to listing `GRANT OPTION` as a privilege.

## Global Privileges

The following table lists the privileges that can be granted globally. You can also grant all database, table, and function privileges globally. When granted globally, these privileges apply to all databases, tables, or functions, including those created later.

To set a global privilege, use `*.*` for *priv\_level*.

### BINLOG ADMIN

Enables administration of the [binary log](#), including the [PURGE BINARY LOGS](#) statement and setting the [binlog\\_annotate\\_row\\_events](#), [binlog\\_cache\\_size](#), [binlog\\_commit\\_wait\\_count](#), [binlog\\_commit\\_wait\\_usec](#), [binlog\\_direct\\_non\\_transactional\\_updates](#), [binlog\\_expire\\_logs\\_seconds](#), [binlog\\_file\\_cache\\_size](#), [binlog\\_format](#), [binlog\\_row\\_image](#), [binlog\\_row\\_metadata](#), [binlog\\_stmt\\_cache\\_size](#), [expire\\_logs\\_days](#), [log\\_bin\\_compress](#), [log\\_bin\\_compress\\_min\\_len](#), [log\\_bin\\_trust\\_function\\_creators](#), [max\\_binlog\\_cache\\_size](#), [max\\_binlog\\_size](#), [max\\_binlog\\_stmt\\_cache\\_size](#), [sql\\_log\\_bin](#) and [sync\\_binlog](#) system variables. Added in [MariaDB 10.5.2](#).

### BINLOG MONITOR

New name for [REPLICATION CLIENT](#) from [MariaDB 10.5.2](#), (`REPLICATION CLIENT` still supported as an alias for compatibility purposes). Permits running `SHOW` commands related to the [binary log](#), in particular the [SHOW BINLOG STATUS](#), [SHOW REPLICA STATUS](#) and [SHOW BINARY LOGS](#) statements.

## BINLOG REPLAY

Enables replaying the binary log with the [BINLOG](#) statement (generated by [mariadb-binlog](#)), executing [SET timestamp](#) when [secure\\_timestamp](#) is set to [replication](#), and setting the session values of system variables usually included in BINLOG output, in particular [gtid\\_domain\\_id](#), [gtid\\_seq\\_no](#), [pseudo\\_thread\\_id](#) and [server\\_id](#). Added in [MariaDB 10.5.2](#)

## CONNECTION ADMIN

Enables administering connection resource limit options. This includes ignoring the limits specified by [max\\_connections](#) and [max\\_user\\_connections](#) and [max\\_password\\_errors](#), not executing the statements specified in [init\\_connect](#), [killing connections and queries](#) owned by other users as well as setting the following connection-related system variables: [connect\\_timeout](#), [disconnect\\_on\\_expired\\_password](#), [extra\\_max\\_connections](#), [init\\_connect](#), [max\\_connections](#), [max\\_connect\\_errors](#), [max\\_password\\_errors](#), [proxy\\_protocol\\_networks](#), [secure\\_auth](#), [slow\\_launch\\_time](#), [thread\\_pool\\_exact\\_stats](#), [thread\\_pool\\_dedicated\\_listener](#), [thread\\_pool\\_idle\\_timeout](#), [thread\\_pool\\_max\\_threads](#), [thread\\_pool\\_min\\_threads](#), [thread\\_pool\\_mode](#), [thread\\_pool\\_oversubscribe](#), [thread\\_pool\\_prio\\_kickup\\_timer](#), [thread\\_pool\\_priority](#), [thread\\_pool\\_size](#), [thread\\_pool\\_stall\\_limit](#). Added in [MariaDB 10.5.2](#).

## CREATE USER

Create a user using the [CREATE USER](#) statement, or implicitly create a user with the [GRANT](#) statement.

## FEDERATED ADMIN

Execute [CREATE SERVER](#), [ALTER SERVER](#), and [DROP SERVER](#) statements. Added in [MariaDB 10.5.2](#).

## FILE

Read and write files on the server, using statements like [LOAD DATA INFILE](#) or functions like [LOAD\\_FILE\(\)](#). Also needed to create [CONNECT](#) outward tables. MariaDB server must have the permissions to access those files.

## GRANT OPTION

Grant global privileges. You can only grant privileges that you have.

## PROCESS

Show information about the active processes, for example via [SHOW PROCESSLIST](#) or [mysqladmin processlist](#). If you have the PROCESS privilege, you can see all threads. Otherwise, you can see only your own threads (that is, threads associated with the MariaDB account that you are using).

## READ\_ONLY ADMIN

User can set the [read\\_only](#) system variable and allows the user to perform write operations, even when the [read\\_only](#) option is active. Added in [MariaDB 10.5.2](#).

## RELOAD

Execute [FLUSH](#) statements or equivalent [mariadb-admin/mysqladmin](#) commands.

## REPLICATION CLIENT

Execute [SHOW MASTER STATUS](#), [SHOW SLAVE STATUS](#) and [SHOW BINARY LOGS](#) informative statements. Renamed to [BINLOG MONITOR](#) in [MariaDB 10.5.2](#) (but still supported as an alias for compatibility reasons).

## REPLICATION MASTER ADMIN

Permits administration of primary servers, including the [SHOW REPLICATION HOSTS](#) statement, and setting the [gtid\\_binlog\\_state](#), [gtid\\_domain\\_id](#), [master\\_verify\\_checksum](#) and [server\\_id](#) system variables. Added in [MariaDB 10.5.2](#).

## REPLICATION MONITOR

Permit [SHOW REPLICATION STATUS](#) and [SHOW RELAY LOG EVENTS](#). From [MariaDB 10.5.9](#).

When a user would upgrade from an older major release to a [MariaDB 10.5](#) minor release prior to [MariaDB 10.5.9](#), certain user accounts would lose capabilities. For example, a user account that had the REPLICATION CLIENT privilege in older major releases could run [SHOW REPLICATION STATUS](#), but after upgrading to a [MariaDB 10.5](#) minor release prior to [MariaDB 10.5.9](#), they could no longer run [SHOW REPLICATION STATUS](#), because that statement was changed to require the REPLICATION REPLICATIONADMIN privilege.

This issue is fixed in [MariaDB 10.5.9](#) with this new privilege, which now grants the user the ability to execute [SHOW \[ALL\] \(SLAVE | REPLICATION\) STATUS](#).

When a database is upgraded from an older major release to MariaDB Server 10.5.9 or later, any user accounts with the REPLICATION CLIENT or REPLICATION SLAVE privileges will automatically be granted the new REPLICATION MONITOR privilege. The privilege fix occurs when the server is started up, not when mariadb-upgrade is performed.

However, when a database is upgraded from an early 10.5 minor release to 10.5.9 and later, the user will have to fix any user account privileges manually.

## REPLICATION REPLICA

Synonym for [REPLICATION SLAVE](#). From [MariaDB 10.5.1](#).

## REPLICATION SLAVE

Accounts used by replica servers on the primary need this privilege. This is needed to get the updates made on the master. From [MariaDB 10.5.1](#), [REPLICATION REPLICA](#) is an alias for [REPLICATION SLAVE](#).

## REPLICATION SLAVE ADMIN

Permits administering replica servers, including [START REPLICATION SLAVE](#), [STOP REPLICATION SLAVE](#), [CHANGE MASTER](#), [SHOW REPLICATION SLAVE STATUS](#), [SHOW RELAY LOG EVENTS](#) statements, replaying the binary log with the [BINLOG](#) statement (generated by [mariadb-binlog](#)), and setting the [gtid\\_cleanup\\_batch\\_size](#), [gtid\\_ignore\\_duplicates](#), [gtid\\_pos\\_auto\\_engines](#), [gtid\\_slave\\_pos](#), [gtid\\_strict\\_mode](#), [init\\_slave](#), [read\\_binlog\\_speed\\_limit](#), [relay\\_log\\_purge](#),

[relay\\_log\\_recovery](#), [replicate\\_do\\_db](#), [replicate\\_do\\_table](#), [replicate\\_events\\_marked\\_for\\_skip](#), [replicate\\_ignore\\_db](#), [replicate\\_ignore\\_table](#), [replicate\\_wild\\_do\\_table](#), [replicate\\_wild\\_ignore\\_table](#), [slave\\_compressed\\_protocol](#), [slave\\_ddl\\_exec\\_mode](#), [slave\\_domain\\_parallel\\_threads](#), [slave\\_exec\\_mode](#), [slave\\_max\\_allowed\\_packet](#), [slave\\_net\\_timeout](#), [slave\\_parallel\\_max\\_queued](#), [slave\\_parallel\\_mode](#), [slave\\_parallel\\_threads](#), [slave\\_parallel\\_workers](#), [slave\\_run\\_triggers\\_for\\_rbr](#), [slave\\_sql\\_verify\\_checksum](#), [slave\\_transaction\\_retry\\_interval](#), [slave\\_type\\_conversions](#), [sync\\_master\\_info](#), [sync\\_relay\\_log](#) and [sync\\_relay\\_log\\_info](#) system variables. Added in [MariaDB 10.5.2](#).

SET USER

Enables setting the `DEFINER` when creating [triggers](#), [views](#), [stored functions](#) and [stored procedures](#). Added in [MariaDB 10.5.2](#).

SHOW DATABASES

List all databases using the [SHOW DATABASES](#) statement. Without the `SHOW DATABASES` privilege, you can still issue the `SHOW DATABASES` statement, but it will only list databases containing tables on which you have privileges.

SHUTDOWN

Shut down the server using [SHUTDOWN](#) or the [mysqladmin shutdown](#) command.

SUPER

Execute superuser statements: [CHANGE MASTER TO](#), [KILL](#) (users who do not have this privilege can only `KILL` their own threads), [PURGE LOGS](#), [SET global system variables](#), or the [mysqladmin debug](#) command. Also, this permission allows the user to write data even if the [read\\_only](#) startup option is set, enable or disable logging, enable or disable replication on replica, specify a `DEFINER` for statements that support that clause, connect once after reaching the `MAX_CONNECTIONS`. If a statement has been specified for the [init-connect](#) `mysql` option, that command will not be executed when a user with `SUPER` privileges connects to the server.

The `SUPER` privilege has been split into multiple smaller privileges from [MariaDB 10.5.2](#) to allow for more fine-grained privileges, although it remains an alias for these smaller privileges.

Database Privileges

The following table lists the privileges that can be granted at the database level. You can also grant all table and function privileges at the database level. Table and function privileges on a database apply to all tables or functions in that database, including those created later.

To set a privilege for a database, specify the database using `db_name.*` for *priv\_level*, or just use `*` to specify the default database.

Privilege	Description
CREATE	Create a database using the <a href="#">CREATE DATABASE</a> statement, when the privilege is granted for a database. You can grant the <code>CREATE</code> privilege on databases that do not yet exist. This also grants the <code>CREATE</code> privilege on all tables in the database.
CREATE ROUTINE	Create Stored Programs using the <a href="#">CREATE PROCEDURE</a> and <a href="#">CREATE FUNCTION</a> statements.
CREATE TEMPORARY TABLES	Create temporary tables with the <a href="#">CREATE TEMPORARY TABLE</a> statement. This privilege enable writing and dropping those temporary tables
DROP	Drop a database using the <a href="#">DROP DATABASE</a> statement, when the privilege is granted for a database. This also grants the <code>DROP</code> privilege on all tables in the database.
EVENT	Create, drop and alter <code>EVENT</code> S.
GRANT OPTION	Grant database privileges. You can only grant privileges that you have.
LOCK TABLES	Acquire explicit locks using the <a href="#">LOCK TABLES</a> statement; you also need to have the <code>SELECT</code> privilege on a table, in order to lock it.

Table Privileges

Privilege	Description
ALTER	Change the structure of an existing table using the <a href="#">ALTER TABLE</a> statement.
CREATE	Create a table using the <a href="#">CREATE TABLE</a> statement. You can grant the <code>CREATE</code> privilege on tables that do not yet exist.
CREATE VIEW	Create a view using the <a href="#">CREATE VIEW</a> statement.
DELETE	Remove rows from a table using the <a href="#">DELETE</a> statement.
DELETE HISTORY	Remove <a href="#">historical rows</a> from a table using the <a href="#">DELETE HISTORY</a> statement. Displays as <code>DELETE VERSIONING ROWS</code> when running <a href="#">SHOW GRANTS</a> until <a href="#">MariaDB 10.3.15</a> and until <a href="#">MariaDB 10.4.5</a> (MDEV-17655), or when running <code>SHOW PRIVILEGES</code> until <a href="#">MariaDB 10.5.2</a> , <a href="#">MariaDB 10.4.13</a> and <a href="#">MariaDB 10.3.23</a> (MDEV-20382). From <a href="#">MariaDB 10.3.4</a> . From <a href="#">MariaDB 10.3.5</a> , if a user has the <code>SUPER</code> privilege but not this privilege, running <a href="#">mysql_upgrade</a> will grant this privilege as well.
DROP	Drop a table using the <a href="#">DROP TABLE</a> statement or a view using the <a href="#">DROP VIEW</a> statement. Also required to execute the <a href="#">TRUNCATE TABLE</a> statement.
GRANT OPTION	Grant table privileges. You can only grant privileges that you have.
INDEX	Create an index on a table using the <a href="#">CREATE INDEX</a> statement. Without the <code>INDEX</code> privilege, you can still create indexes when creating a table using the <a href="#">CREATE TABLE</a> statement if the you have the <code>CREATE</code> privilege, and you can create indexes using the <a href="#">ALTER TABLE</a> statement if you have the <code>ALTER</code> privilege.
INSERT	Add rows to a table using the <a href="#">INSERT</a> statement. The <code>INSERT</code> privilege can also be set on individual columns; see <a href="#">Column Privileges</a> below for details.
REFERENCES	Unused.

SELECT	Read data from a table using the <a href="#">SELECT</a> statement. The <code>SELECT</code> privilege can also be set on individual columns; see <a href="#">Column Privileges</a> below for details.
SHOW VIEW	Show the <a href="#">CREATE VIEW</a> statement to create a view using the <a href="#">SHOW CREATE VIEW</a> statement.
TRIGGER	Execute triggers associated to tables you update, execute the <a href="#">CREATE TRIGGER</a> and <a href="#">DROP TRIGGER</a> statements. You will still be able to see triggers.
UPDATE	Update existing rows in a table using the <a href="#">UPDATE</a> statement. <code>UPDATE</code> statements usually include a <code>WHERE</code> clause to update only certain rows. You must have <code>SELECT</code> privileges on the table or the appropriate columns for the <code>WHERE</code> clause. The <code>UPDATE</code> privilege can also be set on individual columns; see <a href="#">Column Privileges</a> below for details.

## Column Privileges

Some table privileges can be set for individual columns of a table. To use column privileges, specify the table explicitly and provide a list of column names after the privilege type. For example, the following statement would allow the user to read the names and positions of employees, but not other information from the same table, such as salaries.

```
GRANT SELECT (name, position) on Employee to 'jeffrey'@'localhost';
```

Privilege	Description
INSERT (column_list)	Add rows specifying values in columns using the <a href="#">INSERT</a> statement. If you only have column-level <code>INSERT</code> privileges, you must specify the columns you are setting in the <code>INSERT</code> statement. All other columns will be set to their default values, or <code>NULL</code> .
REFERENCES (column_list)	Unused.
SELECT (column_list)	Read values in columns using the <a href="#">SELECT</a> statement. You cannot access or query any columns for which you do not have <code>SELECT</code> privileges, including in <code>WHERE</code> , <code>ON</code> , <code>GROUP BY</code> , and <code>ORDER BY</code> clauses.
UPDATE (column_list)	Update values in columns of existing rows using the <a href="#">UPDATE</a> statement. <code>UPDATE</code> statements usually include a <code>WHERE</code> clause to update only certain rows. You must have <code>SELECT</code> privileges on the table or the appropriate columns for the <code>WHERE</code> clause.

## Function Privileges

Privilege	Description
ALTER ROUTINE	Change the characteristics of a stored function using the <a href="#">ALTER FUNCTION</a> statement.
EXECUTE	Use a stored function. You need <code>SELECT</code> privileges for any tables or columns accessed by the function.
GRANT OPTION	Grant function privileges. You can only grant privileges that you have.

## Procedure Privileges

Privilege	Description
ALTER ROUTINE	Change the characteristics of a stored procedure using the <a href="#">ALTER PROCEDURE</a> statement.
EXECUTE	Execute a <a href="#">stored procedure</a> using the <a href="#">CALL</a> statement. The privilege to call a procedure may allow you to perform actions you wouldn't otherwise be able to do, such as insert rows into a table.
GRANT OPTION	Grant procedure privileges. You can only grant privileges that you have.

## Proxy Privileges

Privilege	Description
PROXY	Permits one user to be a proxy for another.

The `PROXY` privilege allows one user to proxy as another user, which means their privileges change to that of the proxy user, and the [CURRENT\\_USER\(\)](#) function returns the user name of the proxy user.

The `PROXY` privilege only works with authentication plugins that support it. The default [mysql\\_native\\_password](#) authentication plugin does not support proxy users.

The [pam](#) authentication plugin is the only plugin included with MariaDB that currently supports proxy users. The `PROXY` privilege is commonly used with the [pam](#) authentication plugin to enable [user and group mapping with PAM](#).

For example, to grant the `PROXY` privilege to an [anonymous account](#) that authenticates with the [pam](#) authentication plugin, you could execute the following:

```
CREATE USER 'dba'@'%' IDENTIFIED BY 'strongpassword';
GRANT ALL PRIVILEGES ON *.* TO 'dba'@'%' ;

CREATE USER ''@'%' IDENTIFIED VIA pam USING 'mariadb';
GRANT PROXY ON 'dba'@'%' TO ''@'%' ;
```

A user account can only grant the `PROXY` privilege for a specific user account if the granter also has the `PROXY` privilege for that specific user account, and if that privilege is defined `WITH GRANT OPTION`. For example, the following example fails because the granter does not have the `PROXY` privilege for that specific user account at all:

```

SELECT USER(), CURRENT_USER();
+-----+-----+
| USER()          | CURRENT_USER() |
+-----+-----+
| alice@localhost | alice@localhost |
+-----+-----+

SHOW GRANTS;
+-----+-----+
| Grants for alice@localhost |
+-----+-----+
| GRANT ALL PRIVILEGES ON *.* TO 'alice'@'localhost' IDENTIFIED BY PASSWORD '*2470C0C06DEE42FD1618BB99005ADCA2EC9D1E19' |
+-----+-----+

GRANT PROXY ON 'dba'@'localhost' TO 'bob'@'localhost';
ERROR 1698 (28000): Access denied for user 'alice'@'localhost'

```

And the following example fails because the granter does have the `PROXY` privilege for that specific user account, but it is not defined `WITH GRANT OPTION` :

```

SELECT USER(), CURRENT_USER();
+-----+-----+
| USER()          | CURRENT_USER() |
+-----+-----+
| alice@localhost | alice@localhost |
+-----+-----+

SHOW GRANTS;
+-----+-----+
| Grants for alice@localhost |
+-----+-----+
| GRANT ALL PRIVILEGES ON *.* TO 'alice'@'localhost' IDENTIFIED BY PASSWORD '*2470C0C06DEE42FD1618BB99005ADCA2EC9D1E19' |
| GRANT PROXY ON 'dba'@'localhost' TO 'alice'@'localhost' |
+-----+-----+

GRANT PROXY ON 'dba'@'localhost' TO 'bob'@'localhost';
ERROR 1698 (28000): Access denied for user 'alice'@'localhost'

```

But the following example succeeds because the granter does have the `PROXY` privilege for that specific user account, and it is defined `WITH GRANT OPTION` :

```

SELECT USER(), CURRENT_USER();
+-----+-----+
| USER()          | CURRENT_USER() |
+-----+-----+
| alice@localhost | alice@localhost |
+-----+-----+

SHOW GRANTS;
+-----+-----+
| Grants for alice@localhost |
+-----+-----+
| GRANT ALL PRIVILEGES ON *.* TO 'alice'@'localhost' IDENTIFIED BY PASSWORD '*2470C0C06DEE42FD1618BB99005ADCA2EC9D1E19' WITH GRANT OPTION |
| GRANT PROXY ON 'dba'@'localhost' TO 'alice'@'localhost' WITH GRANT OPTION |
+-----+-----+

GRANT PROXY ON 'dba'@'localhost' TO 'bob'@'localhost';

```

A user account can grant the `PROXY` privilege for any other user account if the granter has the `PROXY` privilege for the `'@'%'` anonymous user account, like this:

```

GRANT PROXY ON '@%' TO 'dba'@'localhost' WITH GRANT OPTION;

```

For example, the following example succeeds because the user can grant the `PROXY` privilege for any other user account:

```

SELECT USER(), CURRENT_USER();
+-----+-----+
| USER()          | CURRENT_USER() |
+-----+-----+
| alice@localhost | alice@localhost |
+-----+-----+

SHOW GRANTS;
+-----+-----+
| Grants for alice@localhost |
+-----+-----+
| GRANT ALL PRIVILEGES ON *.* TO 'alice'@'localhost' IDENTIFIED BY PASSWORD '*2470C0C06DEE42FD1618BB99005ADCA2EC9D1E19' WITH GRANT OPTION |
| GRANT PROXY ON '@%' TO 'alice'@'localhost' WITH GRANT OPTION |
+-----+-----+

GRANT PROXY ON 'app1_dba'@'localhost' TO 'bob'@'localhost';
Query OK, 0 rows affected (0.004 sec)

GRANT PROXY ON 'app2_dba'@'localhost' TO 'carol'@'localhost';
Query OK, 0 rows affected (0.004 sec)

```

The default `root` user accounts created by `mysql_install_db` have this privilege. For example:

```
GRANT ALL PRIVILEGES ON *.* TO 'root'@'localhost' WITH GRANT OPTION;  
GRANT PROXY ON ''@'%' TO 'root'@'localhost' WITH GRANT OPTION;
```

This allows the default `root` user accounts to grant the `PROXY` privilege for any other user account, and it also allows the default `root` user accounts to grant others the privilege to do the same.

# Authentication Options

The authentication options for the `GRANT` statement are the same as those for the `CREATE USER` statement.

## IDENTIFIED BY 'password'

The optional `IDENTIFIED BY` clause can be used to provide an account with a password. The password should be specified in plain text. It will be hashed by the `PASSWORD` function prior to being stored to the `mysql.user` table.

For example, if our password is `mariadb`, then we can create the user with:

```
GRANT USAGE ON *.* TO foo2@test IDENTIFIED BY 'mariadb';
```

If you do not specify a password with the `IDENTIFIED BY` clause, the user will be able to connect without a password. A blank password is not a wildcard to match any password. The user must connect without providing a password if no password is set.

If the user account already exists and if you provide the `IDENTIFIED BY` clause, then the user's password will be changed. You must have the privileges needed for the `SET PASSWORD` statement to change a user's password with `GRANT`.

The only authentication plugins that this clause supports are `mysql_native_password` and `mysql_old_password`.

## IDENTIFIED BY PASSWORD 'password\_hash'

The optional `IDENTIFIED BY PASSWORD` clause can be used to provide an account with a password that has already been hashed. The password should be specified as a hash that was provided by the `PASSWORD` function. It will be stored to the `mysql.user` table as-is.

For example, if our password is `mariadb`, then we can find the hash with:

```
SELECT PASSWORD('mariadb');  
+-----+  
| PASSWORD('mariadb') |  
+-----+  
| *54958E764CE10E50764C2EECBB71D01F08549980 |  
+-----+  
1 row in set (0.00 sec)
```

And then we can create a user with the hash:

```
GRANT USAGE ON *.* TO foo2@test IDENTIFIED BY PASSWORD '*54958E764CE10E50764C2EECBB71D01F08549980';
```

If you do not specify a password with the `IDENTIFIED BY` clause, the user will be able to connect without a password. A blank password is not a wildcard to match any password. The user must connect without providing a password if no password is set.

If the user account already exists and if you provide the `IDENTIFIED BY` clause, then the user's password will be changed. You must have the privileges needed for the `SET PASSWORD` statement to change a user's password with `GRANT`.

The only authentication plugins that this clause supports are `mysql_native_password` and `mysql_old_password`.

## IDENTIFIED {VIA|WITH} authentication\_plugin

The optional `IDENTIFIED VIA authentication_plugin` allows you to specify that the account should be authenticated by a specific authentication plugin. The plugin name must be an active authentication plugin as per `SHOW PLUGINS`. If it doesn't show up in that output, then you will need to install it with `INSTALL PLUGIN` or `INSTALL SONAME`.

For example, this could be used with the `PAM` authentication plugin:

```
GRANT USAGE ON *.* TO foo2@test IDENTIFIED VIA pam;
```

Some authentication plugins allow additional arguments to be specified after a `USING` or `AS` keyword. For example, the `PAM` authentication plugin accepts a `service name`:

```
GRANT USAGE ON *.* TO foo2@test IDENTIFIED VIA pam USING 'mariadb';
```

The exact meaning of the additional argument would depend on the specific authentication plugin.

MariaDB starting with 10.4.0

The `USING` or `AS` keyword can also be used to provide a plain-text password to a plugin if it's provided as an argument to the `PASSWORD()` function. This is only valid for authentication plugins that have implemented a hook for the `PASSWORD()` function. For example, the `ed25519` authentication plugin supports this:

```
CREATE USER safe@'%' IDENTIFIED VIA ed25519 USING PASSWORD('secret');
```

MariaDB starting with 10.4.3

One can specify many authentication plugins, they all work as alternatives ways of authenticating a user:

```
CREATE USER safe@'%' IDENTIFIED VIA ed25519 USING PASSWORD('secret') OR unix_socket;
```

By default, when you create a user without specifying an authentication plugin, MariaDB uses the [mysql\\_native\\_password](#) plugin.

## Resource Limit Options

MariaDB starting with [10.2.0](#)

[MariaDB 10.2.0](#) introduced a number of resource limit options.

It is possible to set per-account limits for certain server resources. The following table shows the values that can be set per account:

Limit Type	Description
MAX_QUERIES_PER_HOUR	Number of statements that the account can issue per hour (including updates)
MAX_UPDATES_PER_HOUR	Number of updates (not queries) that the account can issue per hour
MAX_CONNECTIONS_PER_HOUR	Number of connections that the account can start per hour
MAX_USER_CONNECTIONS	Number of simultaneous connections that can be accepted from the same account; if it is 0, <code>max_connections</code> will be used instead; if <code>max_connections</code> is 0, there is no limit for this account's simultaneous connections.
MAX_STATEMENT_TIME	Timeout, in seconds, for statements executed by the user. See also <a href="#">Aborting Statements that Exceed a Certain Time to Execute</a> .

If any of these limits are set to 0, then there is no limit for that resource for that user.

To set resource limits for an account, if you do not want to change that account's privileges, you can issue a `GRANT` statement with the `USAGE` privilege, which has no meaning. The statement can name some or all limit types, in any order.

Here is an example showing how to set resource limits:

```
GRANT USAGE ON *.* TO 'someone'@'localhost' WITH
MAX_USER_CONNECTIONS 0
MAX_QUERIES_PER_HOUR 200;
```

The resources are tracked per account, which means `'user'@'server'`; not per user name or per connection.

The count can be reset for all users using [FLUSH USER\\_RESOURCES](#), [FLUSH PRIVILEGES](#) or [mysqladmin reload](#).

Users with the `CONNECTION ADMIN` privilege (in [MariaDB 10.5.2](#) and later) or the `SUPER` privilege are not restricted by `max_user_connections`, `max_connections`, or `max_password_errors`.

Per account resource limits are stored in the [user](#) table, in the [mysql](#) database. Columns used for resources limits are named `max_questions`, `max_updates`, `max_connections` (for `MAX_CONNECTIONS_PER_HOUR`), and `max_user_connections` (for `MAX_USER_CONNECTIONS`).

## TLS Options

By default, MariaDB transmits data between the server and clients without encrypting it. This is generally acceptable when the server and client run on the same host or in networks where security is guaranteed through other means. However, in cases where the server and client exist on separate networks or they are in a high-risk network, the lack of encryption does introduce security concerns as a malicious actor could potentially eavesdrop on the traffic as it is sent over the network between them.

To mitigate this concern, MariaDB allows you to encrypt data in transit between the server and clients using the Transport Layer Security (TLS) protocol. TLS was formerly known as Secure Socket Layer (SSL), but strictly speaking the SSL protocol is a predecessor to TLS and, that version of the protocol is now considered insecure. The documentation still uses the term SSL often and for compatibility reasons TLS-related server system and status variables still use the prefix `ssl_`, but internally, MariaDB only supports its secure successors.

See [Secure Connections Overview](#) for more information about how to determine whether your MariaDB server has TLS support.

You can set certain TLS-related restrictions for specific user accounts. For instance, you might use this with user accounts that require access to sensitive data while sending it across networks that you do not control. These restrictions can be enabled for a user account with the [CREATE USER](#), [ALTER USER](#), or [GRANT](#) statements. The following options are available:

Option	Description
REQUIRE NONE	TLS is not required for this account, but can still be used.
REQUIRE SSL	The account must use TLS, but no valid X509 certificate is required. This option cannot be combined with other TLS options.
REQUIRE X509	The account must use TLS and must have a valid X509 certificate. This option implies <code>REQUIRE SSL</code> . This option cannot be combined with other TLS options.
REQUIRE ISSUER 'issuer'	The account must use TLS and must have a valid X509 certificate. Also, the Certificate Authority must be the one specified via the string <code>issuer</code> . This option implies <code>REQUIRE X509</code> . This option can be combined with the <code>SUBJECT</code> , and <code>CIPHER</code> options in any order.
REQUIRE SUBJECT 'subject'	The account must use TLS and must have a valid X509 certificate. Also, the certificate's Subject must be the one specified via the string <code>subject</code> . This option implies <code>REQUIRE X509</code> . This option can be combined with the <code>ISSUER</code> , and <code>CIPHER</code> options in any order.
REQUIRE CIPHER 'cipher'	The account must use TLS, but no valid X509 certificate is required. Also, the encryption used for the connection must use a specific cipher method specified in the string <code>cipher</code> . This option implies <code>REQUIRE SSL</code> . This option can be combined with the <code>ISSUER</code> , and <code>SUBJECT</code> options in any order.

The `REQUIRE` keyword must be used only once for all specified options, and the `AND` keyword can be used to separate individual options, but it is not required.

For example, you can create a user account that requires these TLS options with the following:

```
GRANT USAGE ON *.* TO 'alice'@'%'  
  REQUIRE SUBJECT '/CN=alice/O=My Dom, Inc./C=US/ST=Oregon/L=Portland'  
  AND ISSUER '/C=FI/ST=Somewhere/L=City/ O=Some Company/CN=Peter Parker/emailAddress=p.parker@marvel.com'  
  AND CIPHER 'SHA-DES-CBC3-EDH-RSA';
```

If any of these options are set for a specific user account, then any client who tries to connect with that user account will have to be configured to connect with TLS.  
See [Securing Connections for Client and Server](#) for information on how to enable TLS on the client and server.

## Roles

### Syntax

```
GRANT role TO grantee [, grantee ... ]  
[ WITH ADMIN OPTION ]  
  
grantee:  
  rolename  
  username [authentication_option]
```

The GRANT statement is also used to grant the use a [role](#) to one or more users or other roles. In order to be able to grant a role, the grantor doing so must have permission to do so (see WITH ADMIN in the [CREATE ROLE](#) article).

Specifying the WITH ADMIN OPTION permits the grantee to in turn grant the role to another.

For example, the following commands show how to grant the same role to a couple different users.

```
GRANT journalist TO hulda;  
  
GRANT journalist TO berengar WITH ADMIN OPTION;
```

If a user has been granted a role, they do not automatically obtain all permissions associated with that role. These permissions are only in use when the user activates the role with the [SET ROLE](#) statement.

## Grant Examples

### Granting Root-like Privileges

You can create a user that has privileges similar to the default `root` accounts by executing the following:

```
CREATE USER 'alexander'@'localhost';  
GRANT ALL PRIVILEGES ON *.* to 'alexander'@'localhost' WITH GRANT OPTION;
```

## H3Dr1.1.1.1.5 RENAME

### Syntax

```
RENAME USER old_user TO new_user  
[ , old_user TO new_user ] ...
```

## Description

The RENAME USER statement renames existing MariaDB accounts. To use it, you must have the global [CREATE USER](#) privilege or the [UPDATE](#) privilege for the `mysql` database. Each account is named using the same format as for the [CREATE USER](#) statement; for example, `'jeffrey'@'localhost'` . If you specify only the user name part of the account name, a host name part of `'%'` is used.

If any of the old user accounts do not exist or any of the new user accounts already exist, `ERROR 1396 (HY000)` results. If an error occurs, `RENAME USER` will still rename the accounts that do not result in an error.

## Examples

```
CREATE USER 'donald', 'mickey';
RENAME USER 'donald' TO 'duck'@'localhost', 'mickey' TO 'mouse'@'localhost';
```

# H3Dr1.1.1.1.6 RE

## Contents

1. [Privileges](#)
  1. [Syntax](#)
  2. [Description](#)
  3. [Examples](#)
2. [Roles](#)
  1. [Syntax](#)
  2. [Description](#)
  3. [Example](#)

## Privileges

### Syntax

```
REVOKE
    priv_type [(column_list)]
    [, priv_type [(column_list)]] ...
    ON [object_type] priv_level
    FROM user [, user] ...

REVOKE ALL PRIVILEGES, GRANT OPTION
    FROM user [, user] ...
```

### Description

The `REVOKE` statement enables system administrators to revoke privileges (or roles - see [section below](#)) from MariaDB accounts. Each account is named using the same format as for the `GRANT` statement; for example, `'jeffrey'@'localhost'`. If you specify only the user name part of the account name, a host name part of `'%'` is used. For details on the levels at which privileges exist, the allowable `priv_type` and `priv_level` values, and the syntax for specifying users and passwords, see [GRANT](#).

To use the first `REVOKE` syntax, you must have the `GRANT OPTION` privilege, and you must have the privileges that you are revoking.

To revoke all privileges, use the second syntax, which drops all global, database, table, column, and routine privileges for the named user or users:

```
REVOKE ALL PRIVILEGES, GRANT OPTION FROM user [, user] ...
```

To use this `REVOKE` syntax, you must have the global [CREATE USER](#) privilege or the [UPDATE](#) [privilege](#) for the `mysql` database. See [GRANT](#).

### Examples

```
REVOKE SUPER ON *.* FROM 'alexander'@'localhost';
```

## Roles

### Syntax

```
REVOKE role [, role ...]
    FROM grantee [, grantee2 ... ]

REVOKE ADMIN OPTION FOR role FROM grantee [, grantee2]
```

### Description

`REVOKE` is also used to remove a [role](#) [from](#) a user or another role that it's previously been assigned to. If a role has previously been set as a [default role](#) [for](#), `REVOKE` does not remove the record of the default role from the `mysql.user` [table](#). If the role is subsequently granted again, it will again be the user's default. Use `SET DEFAULT ROLE NONE` [to](#) explicitly remove this.

Before [MariaDB 10.1.13](#) [release](#), the `REVOKE role` statement was not permitted in [prepared statements](#) [for](#).

### Example

```
REVOKE journalist FROM hulda
```

# H3Dr1.1.1.1.7 SET PASS

### Syntax

```
SET PASSWORD [FOR user] =
{
    PASSWORD('some password')
  | OLD_PASSWORD('some password')
  | 'encrypted password'
}
```

## Contents

1. [Syntax](#)
2. [Description](#)
3. [Authentication Plugin Support](#)
4. [Passwordless User Accounts](#)
5. [Example](#)
6. [See Also](#)

## Description

The `SET PASSWORD` statement assigns a password to an existing MariaDB user account.

If the password is specified using the `PASSWORD()` or `OLD_PASSWORD()` function, the literal text of the password should be given. If the password is specified without using either function, the password should be the already-encrypted password value as returned by `PASSWORD()`.

`OLD_PASSWORD()` should only be used if your MariaDB/MySQL clients are very old (< 4.0.0).

With no `FOR` clause, this statement sets the password for the current user. Any client that has connected to the server using a non-anonymous account can change the password for that account.

With a `FOR` clause, this statement sets the password for a specific account on the current server host. Only clients that have the `UPDATE` privilege for the `mysql` database can do this. The user value should be given in `user_name@host_name` format, where `user_name` and `host_name` are exactly as they are listed in the User and Host columns of the `mysql.user` table entry.

The argument to `PASSWORD()` and the password given to MariaDB clients can be of arbitrary length.

## Authentication Plugin Support

MariaDB starting with [10.4](#)

In [MariaDB 10.4](#) and later, `SET PASSWORD` (with or without `PASSWORD()`) works for accounts authenticated via any authentication plugin that supports passwords stored in the `mysql.global_priv` table.

The `ed25519`, `mysql_native_password`, and `mysql_old_password` authentication plugins store passwords in the `mysql.global_priv` table.

If you run `SET PASSWORD` on an account that authenticates with one of these authentication plugins that stores passwords in the `mysql.global_priv` table, then the `PASSWORD()` function is evaluated by the specific authentication plugin used by the account. The authentication plugin hashes the password with a method that is compatible with that specific authentication plugin.

The `unix_socket`, `named_pipe`, `gssapi`, and `pam` authentication plugins do **not** store passwords in the `mysql.global_priv` table. These authentication plugins rely on other methods to authenticate the user.

If you attempt to run `SET PASSWORD` on an account that authenticates with one of these authentication plugins that doesn't store a password in the `mysql.global_priv` table, then MariaDB Server will raise a warning like the following:

```
SET PASSWORD is ignored for users authenticating via unix_socket plugin
```

See [Authentication from MariaDB 10.4](#) for an overview of authentication changes in [MariaDB 10.4](#).

MariaDB until [10.3](#)

In [MariaDB 10.3](#) and before, `SET PASSWORD` (with or without `PASSWORD()`) only works for accounts authenticated via `mysql_native_password` or `mysql_old_password` authentication plugins

## Passwordless User Accounts

User accounts do not always require passwords to login.

The `unix_socket`, `named_pipe` and `gssapi` authentication plugins do not require a password to authenticate the user.

The `pam` authentication plugin may or may not require a password to authenticate the user, depending on the specific configuration.

The `mysql_native_password` and `mysql_old_password` authentication plugins require passwords for authentication, but the password can be blank. In that case, no password is required.

If you provide a password while attempting to log into the server as an account that doesn't require a password, then MariaDB server will simply ignore the password.

MariaDB starting with [10.4](#)

In [MariaDB 10.4](#) and later, a user account can be defined to use multiple authentication plugins in a specific order of preference. This specific scenario may be more noticeable in these versions, since an account could be associated with some authentication plugins that require a password, and some that do not.

## Example

For example, if you had an entry with User and Host column values of 'bob' and '%.loc.gov', you would write the statement like this:

```
SET PASSWORD FOR 'bob'@'%.loc.gov' = PASSWORD('newpass');
```

If you want to delete a password for a user, you would do:

```
SET PASSWORD FOR 'bob'@localhost = PASSWORD("");
```

## Description

The `CREATE ROLE` statement creates one or more MariaDB [roles](#). To use it, you must have the global [CREATE USER](#) privilege or the [INSERT](#) privilege for the `mysql` database. For each account, `CREATE ROLE` creates a new row in the `mysql.user` table that has no privileges, and with the corresponding `is_role` field set to `Y`. It also creates a record in the `mysql.roles_mapping` table.

If any of the specified roles already exist, `ERROR 1396 (HY000)` results. If an error occurs, `CREATE ROLE` will still create the roles that do not result in an error. The maximum length for a role is 128 characters. Role names can be quoted, as explained in the [Identifier names](#) page. Only one error is produced for all roles which have not been created:

```
ERROR 1396 (HY000): Operation CREATE ROLE failed for 'a','b','c'
```

Failed `CREATE` or `DROP` operations, for both users and roles, produce the same error code.

`PUBLIC` and `NONE` are reserved, and cannot be used as role names. `NONE` is used to [unset a role](#) and `PUBLIC` has a special use in other systems, such as Oracle, so is reserved for compatibility purposes.

Before [MariaDB 10.1.13](#), the `CREATE ROLE` statement was not permitted in [prepared statements](#).

For valid identifiers to use as role names, see [Identifier Names](#).

### WITH ADMIN

The optional `WITH ADMIN` clause determines whether the current user, the current role or another user or role has use of the newly created role. If the clause is omitted, `WITH ADMIN CURRENT_USER` is treated as the default, which means that the current user will be able to [GRANT](#) this role to users.

### OR REPLACE

If the optional `OR REPLACE` clause is used, it acts as a shortcut for:

```
DROP ROLE IF EXISTS name;
CREATE ROLE name ...;
```

### IF NOT EXISTS

When the `IF NOT EXISTS` clause is used, MariaDB will return a warning instead of an error if the specified role already exists. Cannot be used together with the `OR REPLACE` clause.

## Examples

```
CREATE ROLE journalist;

CREATE ROLE developer WITH ADMIN lorinda@localhost;
```

Granting the role to another user. Only user `lorinda@localhost` has permission to grant the `developer` role:

```

SELECT USER();
+-----+
| USER() |
+-----+
| henning@localhost |
+-----+
...
GRANT developer TO ian@localhost;
Access denied for user 'henning'@'localhost'

SELECT USER();
+-----+
| USER() |
+-----+
| lorinda@localhost |
+-----+

GRANT m_role TO ian@localhost;

```

The `OR REPLACE` and `IF NOT EXISTS` clauses. The `journalist` role already exists:

```

CREATE ROLE journalist;
ERROR 1396 (HY000): Operation CREATE ROLE failed for 'journalist'

CREATE OR REPLACE ROLE journalist;
Query OK, 0 rows affected (0.00 sec)

CREATE ROLE IF NOT EXISTS journalist;
Query OK, 0 rows affected, 1 warning (0.00 sec)

```

```

SHOW WARNINGS;
+-----+-----+-----+
| Level | Code | Message |
+-----+-----+-----+
| Note  | 1975 | Can't create role 'journalist'; it already exists |
+-----+-----+-----+

```
